

CONFIDENTIAL - FOR PEER-REVIEW ONLY

Acceptability lies in the eye of the beholder - Study 4 (#126377)

Created: 03/24/2023 02:56 AM (PT)

This is an anonymized copy (without author names) of the pre-registration. It was created by the author(s) to use during peer-review.
A non-anonymized version (containing author names) should be made available by the authors when the work it supports is made public.

1) Have any data been collected for this study already?

No, no data have been collected for this study yet.

2) What's the main question being asked or hypothesis being tested in this study?

We will provide participants with general information about ChatGPT and what it can do (i.e., generating ideas or suggesting sources). Then we will assess participants' perception of how much they (vs. others) contribute to a task (i.e., perceived contribution) if they (vs. others) use ChatGPT. We predict to find higher perceived contribution in the self (vs. other) condition.

3) Describe the key dependent variable(s) specifying how they will be measured.

Our key dependent variable is perceived contribution. Participants are asked to distribute 100% across themselves (vs. others) and ChatGPT. The higher the percentage allocated to themselves (vs. others), the higher the perceived contribution.

4) How many and which conditions will participants be assigned to?

Participants will be randomly assigned to the self-condition (you) or to the other-condition (others). In both conditions, participants are informed about Chat GPT and then answer questions about their (vs. others') perceived usage behavior of ChatGPT. We refer to our manipulation as self- versus other manipulation.

5) Specify exactly which analyses you will conduct to examine the main question/hypothesis.

We will conduct an independent samples t-test with perceived contribution as the dependent variable and condition (self versus other) as the independent variable.

6) Describe exactly how outliers will be defined and handled, and your precise rule(s) for excluding observations.

At the end of the survey, we ask participants to recall what type of an artificial intelligence (AI) tool we provided information for; those participants who failed to correctly recall the tool (i.e., an artificial intelligence (AI)-powered chatbot) will be excluded from the analysis.

7) How many observations will be collected or what will determine sample size? No need to justify decision, but be precise about exactly how the number will be determined.

We will recruit 250 participants through Prolific. We will restrict participation to individuals on Prolific who have indicated that: (1) their current country of residence is United Kingdom, (2) they have a minimum of 98% approval rate, and (3) they have not participated in studies of the focal researcher that employed a similar topic as the current study.

8) Anything else you would like to pre-register? (e.g., secondary analyses, variables collected for exploratory purposes, unusual analyses planned?)

We will measure several additional variables for exploratory purposes and assess whether our manipulation affects these measures.

-Way of collaborating with AI: We will assess whether there are any differences in the extent to which participants agree with the statements that "When using ChatGPT, I (vs. others) only use it to get inspired", "When using ChatGPT, I (vs. others) do not directly copy anything ChatGPT suggests" and " When using ChatGPT, I (vs. others) still put in their own work" (1=Strongly disagree, 7=Strongly agree). We will create an index by taking the average of participants' responses to these three items and assess whether there are any differences across conditions. If yes, we will conduct a mediation analysis with condition as the independent variable, way of collaborating with AI index as the mediator, and perceived contribution as the dependent variable.

-Psychological ownership: We will assess to what extent participants agree with the statement that "When using ChatGPT, the output represents my (vs. others') own work" (1=Strongly disagree, 7=Strongly agree).

-We will explore whether the effect of our self- versus other manipulation on perceived contribution depends on whether participants have experience with ChatGPT. Thus, we will ask whether participants used ChatGPT before and explore the interaction between prior usage (yes/no) and our manipulation on perceived contribution.
